

I feel that your new proposal to have location information on VO-IP phones will be almost impossible to implement. Just the task of registering Wi-Fi access points will be beyond the scope of any RF device registration the FCC has ever taken on, if I'm not mistaken.

How will you track APs that move, such as those that traveling sales people take with them to hotels/meetings/conferences?

911 service will provide plenty of coverage with landlines and cell phones. Please let the market develop naturally and come up with a solution for those consumers who wish to have the added service.

Sincerely,
John Bahr
